Abstract

Please amend the abstract as follows:

The invention relates to a \underline{A} method and a briquetting press for briquetting metal chips, wherein \underline{A} method and a briquettes for briquetting metal chips, wherein \underline{A} method are produced stable briquettes for briquettes for briquettes are produced. The actual length (\underline{L}_{act}) of the pressed component is obtained by applying pressure ($\underline{P}_{max}/\underline{P}_{req}$) using at least one pressing ram (1, 2) and measuring the length with a measuring device (5, 6). The measured value is compared to a desired nominal value (\underline{L}_{nom}) and a difference value ($\underline{\square}$) is subsequently determined.
